Stefan Vonbun

# Challenges

## Austria

solution: **SUSTAINABILITY**  
technical AND economical

quality behaviour

life cycle costing  
(LCC)

*LCM*

# Quality Behaviour

A good track behaves well,  
a poor one deteriorates faster.

life cycle cost - structures

degradation depends on present quality level

quality behaviour of track

$$Q(t) = Q_0 \times e^{bt}$$

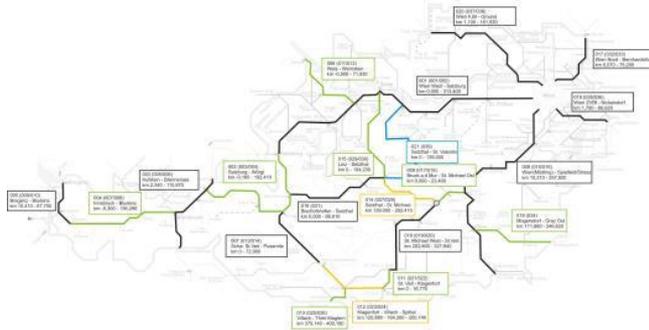

investment + maintenance  $\neq$  = LCC

costs of operational hindrances

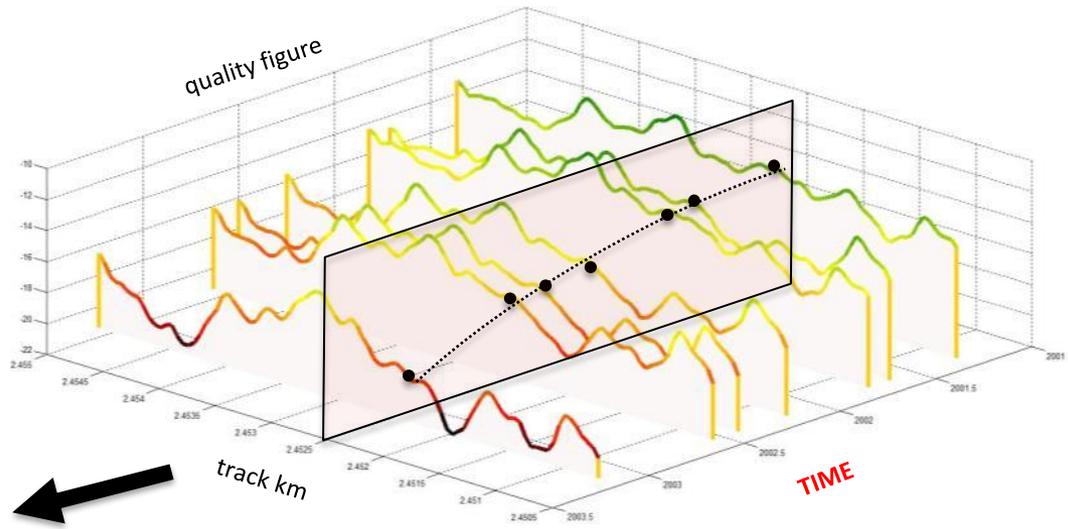

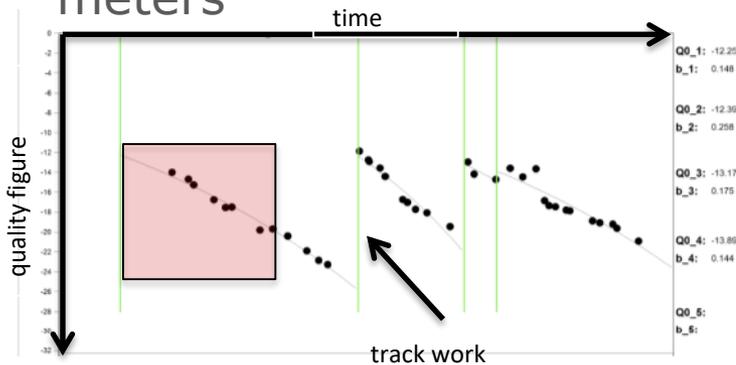

# Quality Behaviour – Technical Evaluation

TUG-Datenbank

- measured data since 2001
- data of 4,000 km of main track: type and age of track and components, all recording car data, maintenance executed, transport data and alignment

Regression analyses based on quality figures as standard deviation every 5 meters

$$Q(t) = Q_n \times e^{b_n t}$$
 general behaviour but variation in „b“, related to the various track parameters

# Standard Kilometres

## Main Track-Parameters

transport volume [gross-tonnes/day, track]	track [number]	rail profile [ ]	rail steel grade [ ]	sleeper [ ]	radius [m]	rails [ ]	subsoil condition [ ]
> 70,000	1	60E1	R400HT	concrete	> 3,000 m	CWT	good
45,000 - 70,000	2	54E2	R350HT	concrete USP	1,000 m - 3,000 m	jointed	weak
30,000 - 45,000	2+2	49E1	R260	wooden	600 m - 1,000 m		poor
15,000 - 30,000			R200	HDS USP	400 m - 600 m		bad
8,000 - 15,000					250 m - 400 m		
2,000 - 8,000					< 250 m		
< 2,000							

300 relevant combinations → 80 describe economic target situation

# Service Life Track – Limiting Components

## Rails

Rails can be easily changed. Rail exchange is costly but “cheap” compared to other measures.

## Sleepers

Sleeper exchange is enormously costly and not easy to be executed on a high quality level. But: Concrete sleepers can reach service lives of 50 years, steel sleepers as well. Wooden sleepers are worn out latest at 30 years life span.

## Ballast

Also ballast can be changed or at least cleaned. It’s a very costly measure.

Ballast is in general the component limiting the service life of entire track.

Furthermore, within the ranking of cost drivers ballast is the third on the list, after initial quality and switch density.

# Component Strategies Sleepers

Concrete sleepers are generally the best option (on proper substructure):

- I High side resistance
- I Low investment
- I Low maintenance demand
- I Long service life
- I **But: High deterioration of ballast**

Tests show that conventional concrete sleepers have less than 10% contact area to the ballast bed (without using Dynamic Track Stabilising).

**Solution?**

# Sleepers with Under Sleeper Pads

Underneath the concrete sleeper a polyurethane layer is introduced.

This gives two main benefits:

- I Additional elasticity → distribution of the load to more sleepers
- I Contact area between ballast and sleeper is increased → reduction of stresses in ballast bed

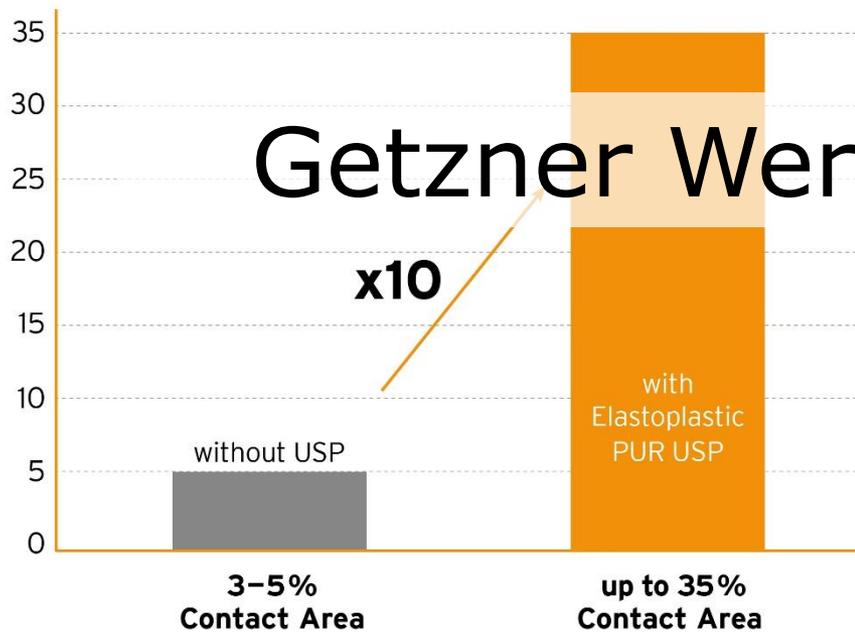

**CONTACT AREA**  
**sleeper - ballast**  
**without DGS**  
**using DGS**

**Initial settlement is reduced → initial quality increases → track deterioration is reduced**

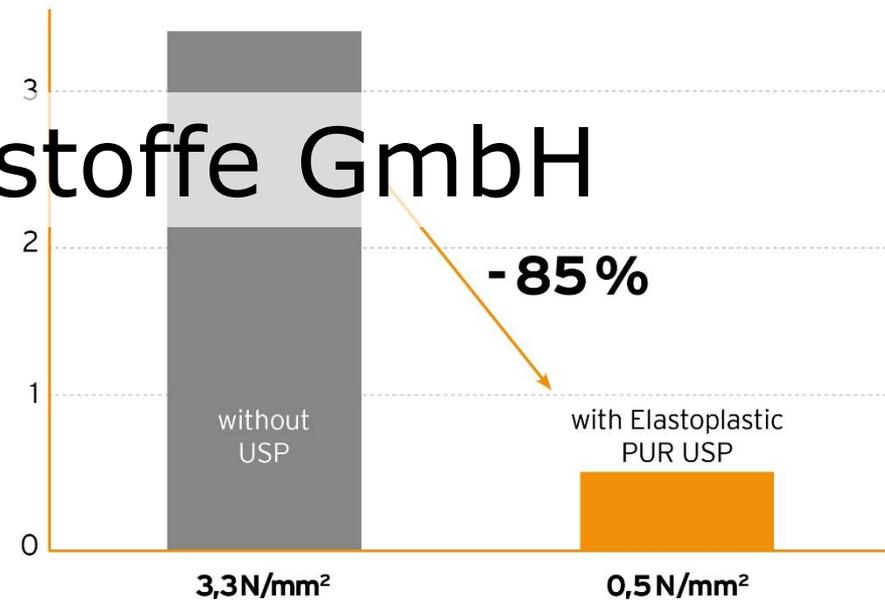

# Reduction of Contact Pressure

Contact Area (%)

Ballast Contact Pressure (N/mm<sup>2</sup>)

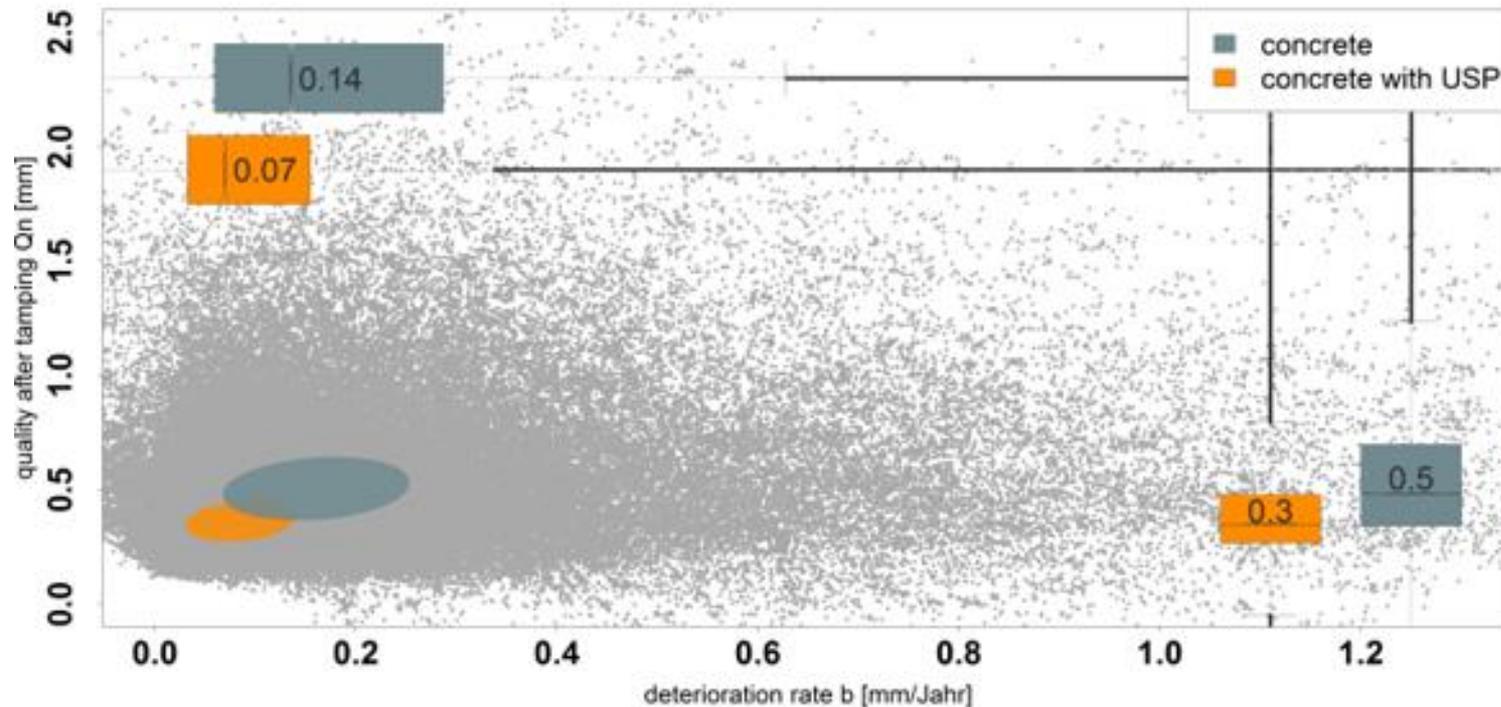

Getzner Werkstoffe GmbH

# Under Sleeper Pads

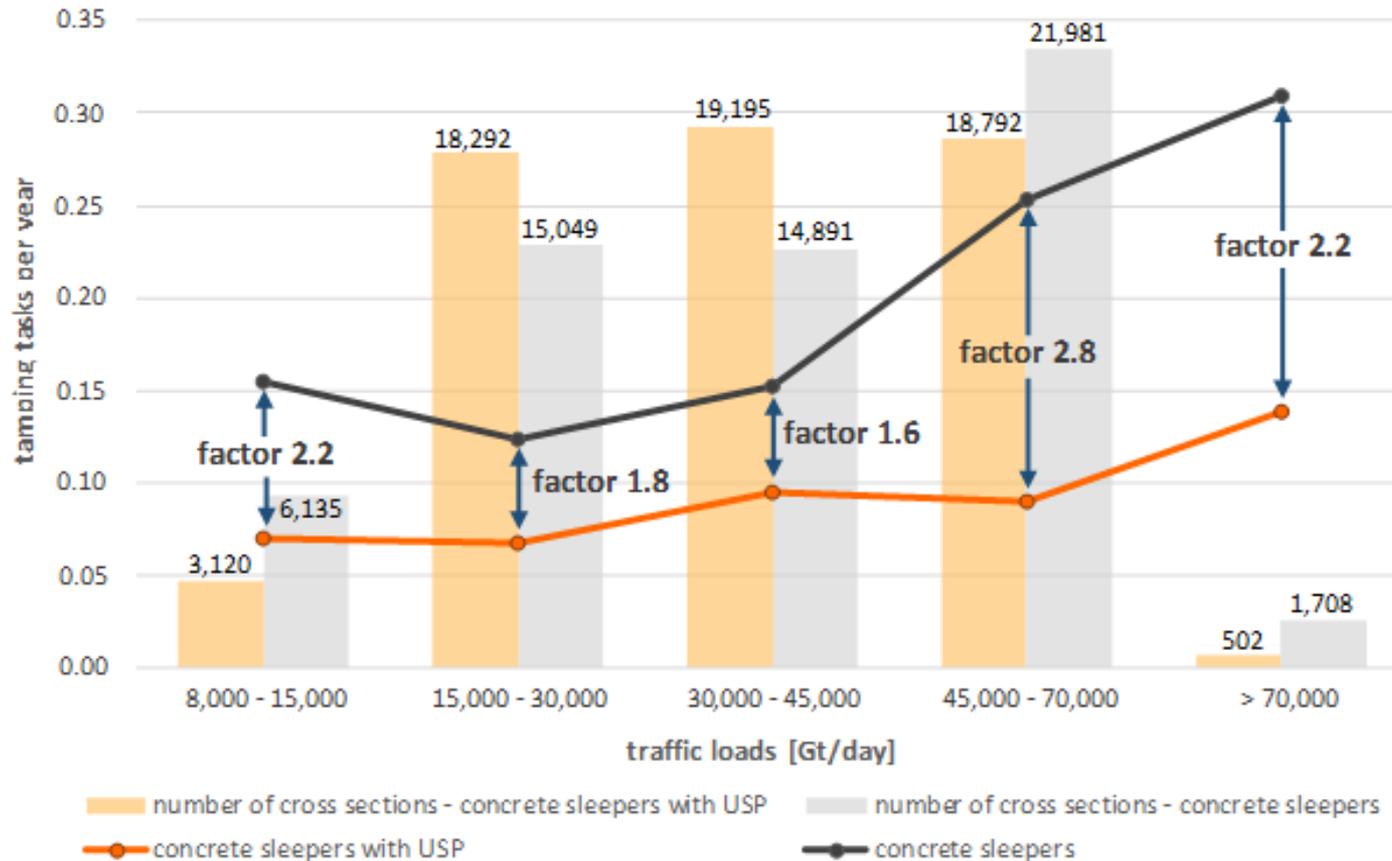

Evaluation from the OeBB Network ( $\sim 60,000$  sections)

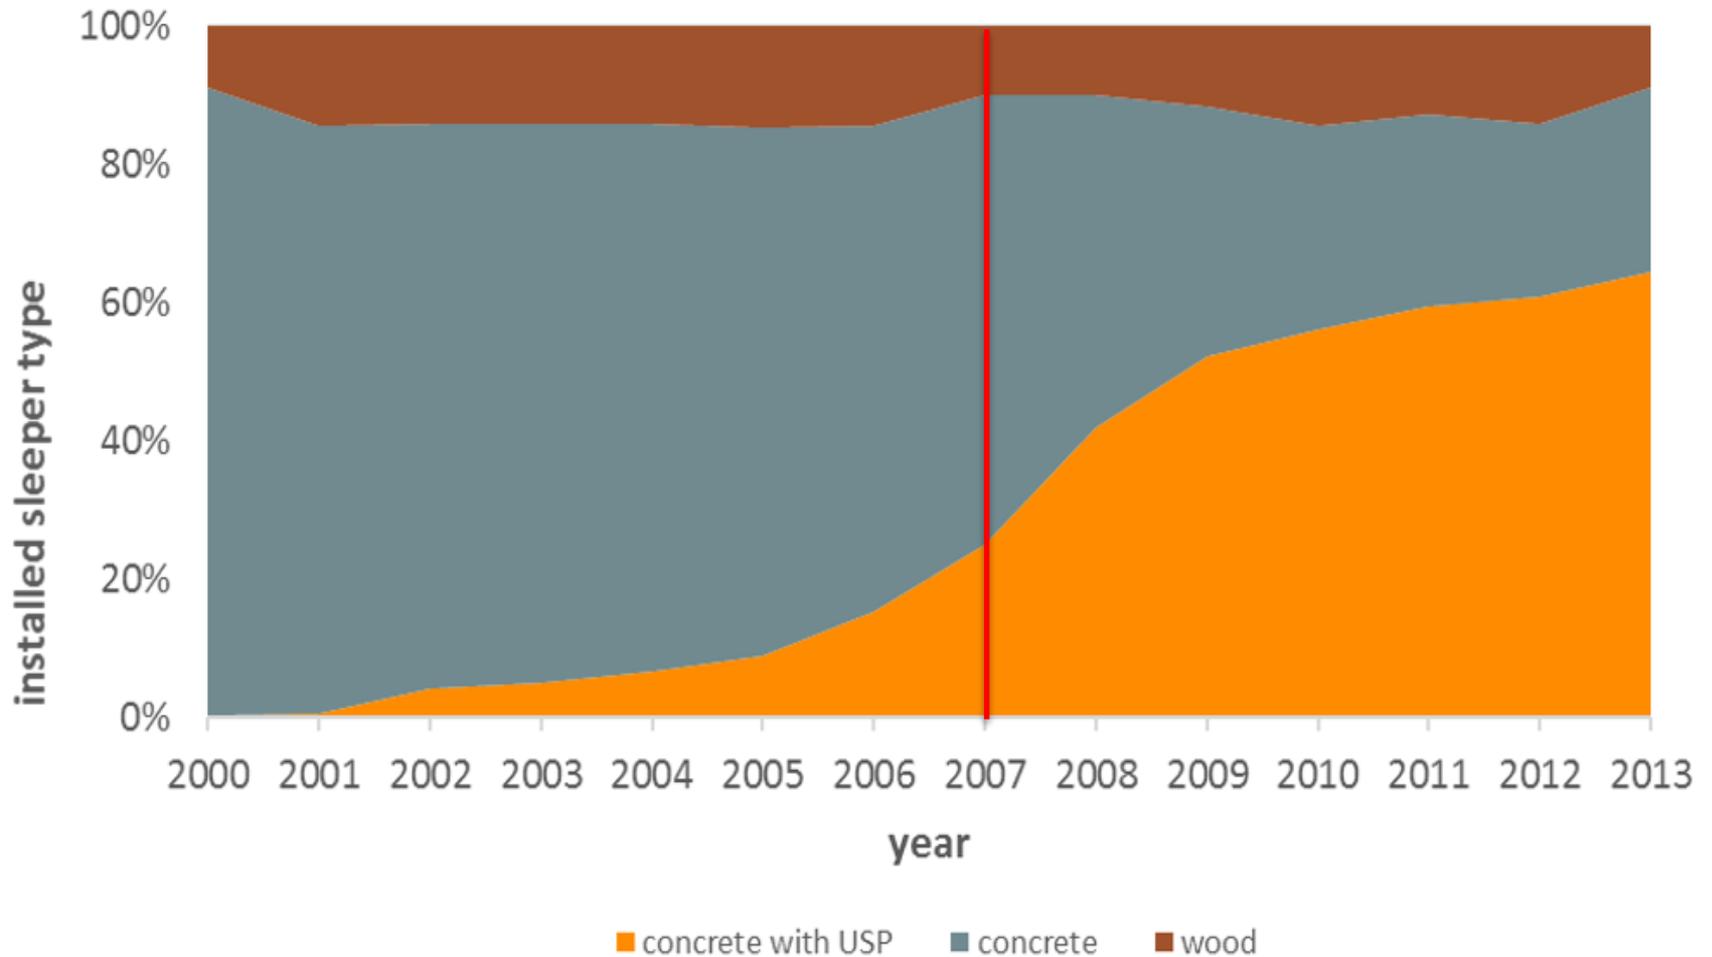

Initial settlement is reduced  $\rightarrow$  initial quality increases  $\rightarrow$  track deterioration is reduced

# Under Sleeper Pads

Tamping demand is halved!

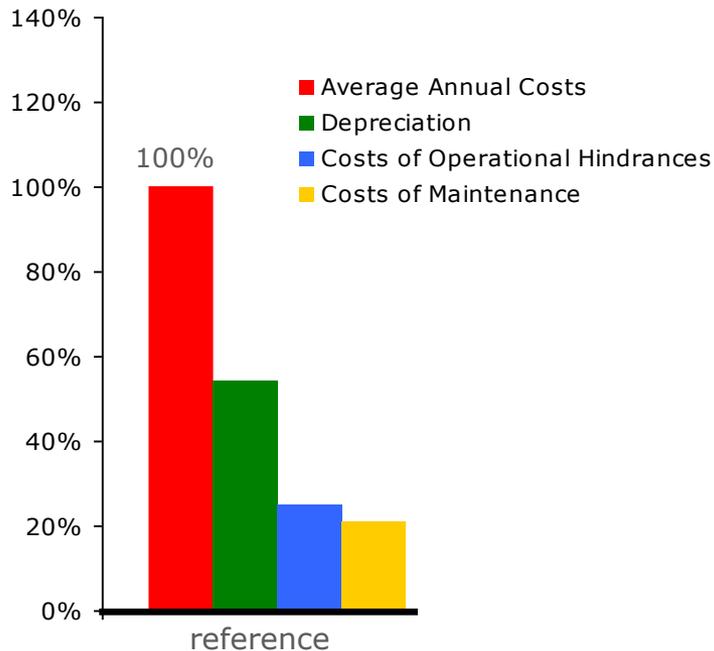

# Under Sleeper Pads - Implementation

# Under Sleeper Pads

## Economic Evaluation (UIC leaflet)

*IRR up to 20% for  
high loaded  
sections*

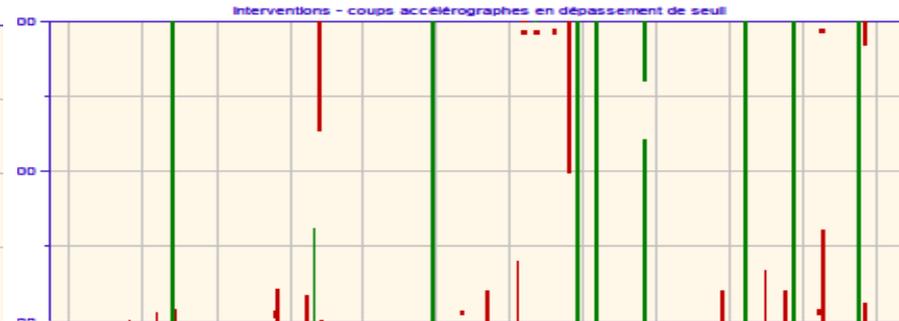

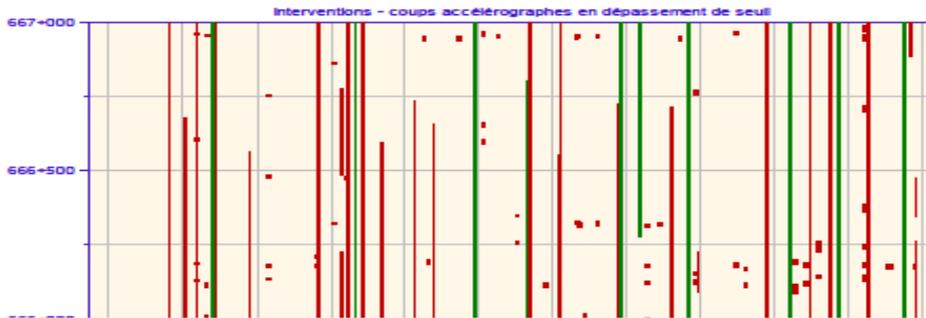

# Under Sleeper Pads – TGV in France

without USP

with USP

Historique des orlations - 762000 - V2 (378+200;709+881)

$$\sigma_v = 1.3 \text{ mm (1 km)}$$

$$\sigma_v = 0.6 \text{ mm (1 km)}$$

TGV: high speed line 320 km/h

Report No. 1 / 2017

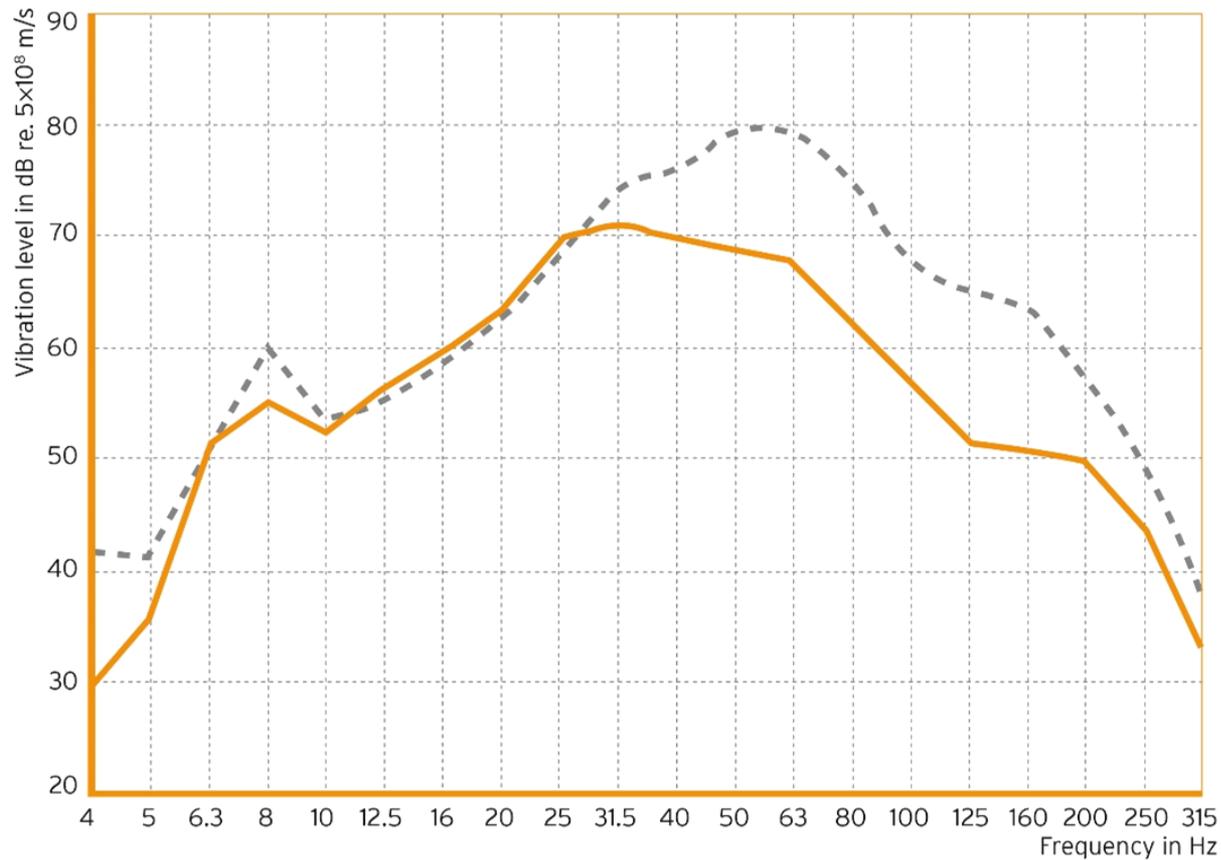

## Measurement Results of Vibration Isolation Performance Getzner Under Sleeper Pads SLS1308 at Kraków Łobzów

<b>TASK</b>	Measurements of Vibration Mitigation of concrete sleepers with Under Sleeper Pads (USP)
<b>DESCRIPTION</b>	This report is made in accordance with the free field investigations with USP from Getzner Werkstoffe GmbH
<b>DATE OF MEASUREMENTS</b>	14 <sup>th</sup> September 2016
<b>TEST SITE / LOCATION</b>	Line No. 118 Nearby Station Kraków Łobzów / Poland
<b>REPORT DATE</b>	15 <sup>th</sup> August 2017
<b>REPORT BY</b>	..... Dr. Ewelina Kwiatkowska, Dr. J. Groseł, DI M. Heim, Dr. H. Loy
<b>APPLICATION PICTURE</b>	

# Vibration Reduction with USP SLS 1308

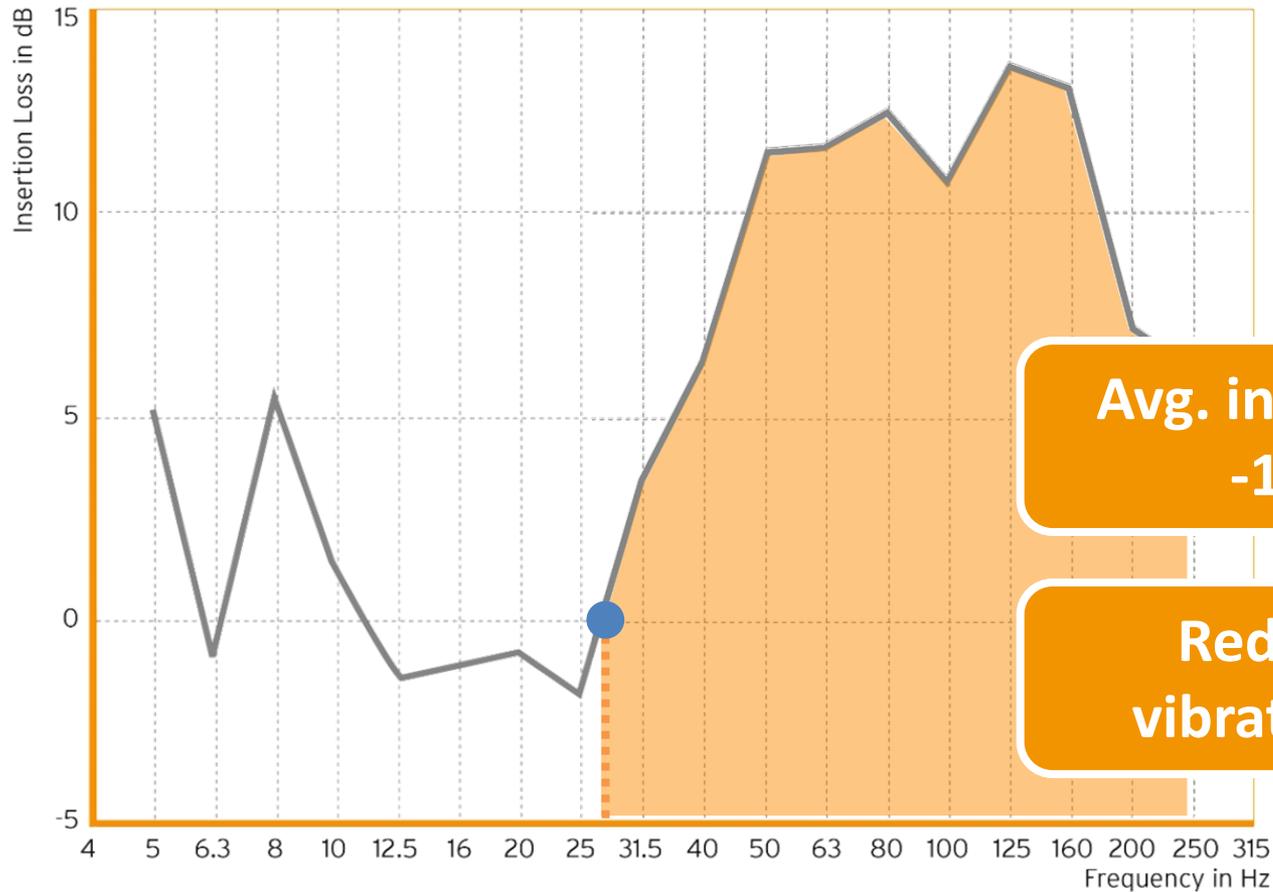

### Vibration level with / without USP

— AVE with USP    - - - AVE without USP

# Vibration Reduction with USP SLS 1308

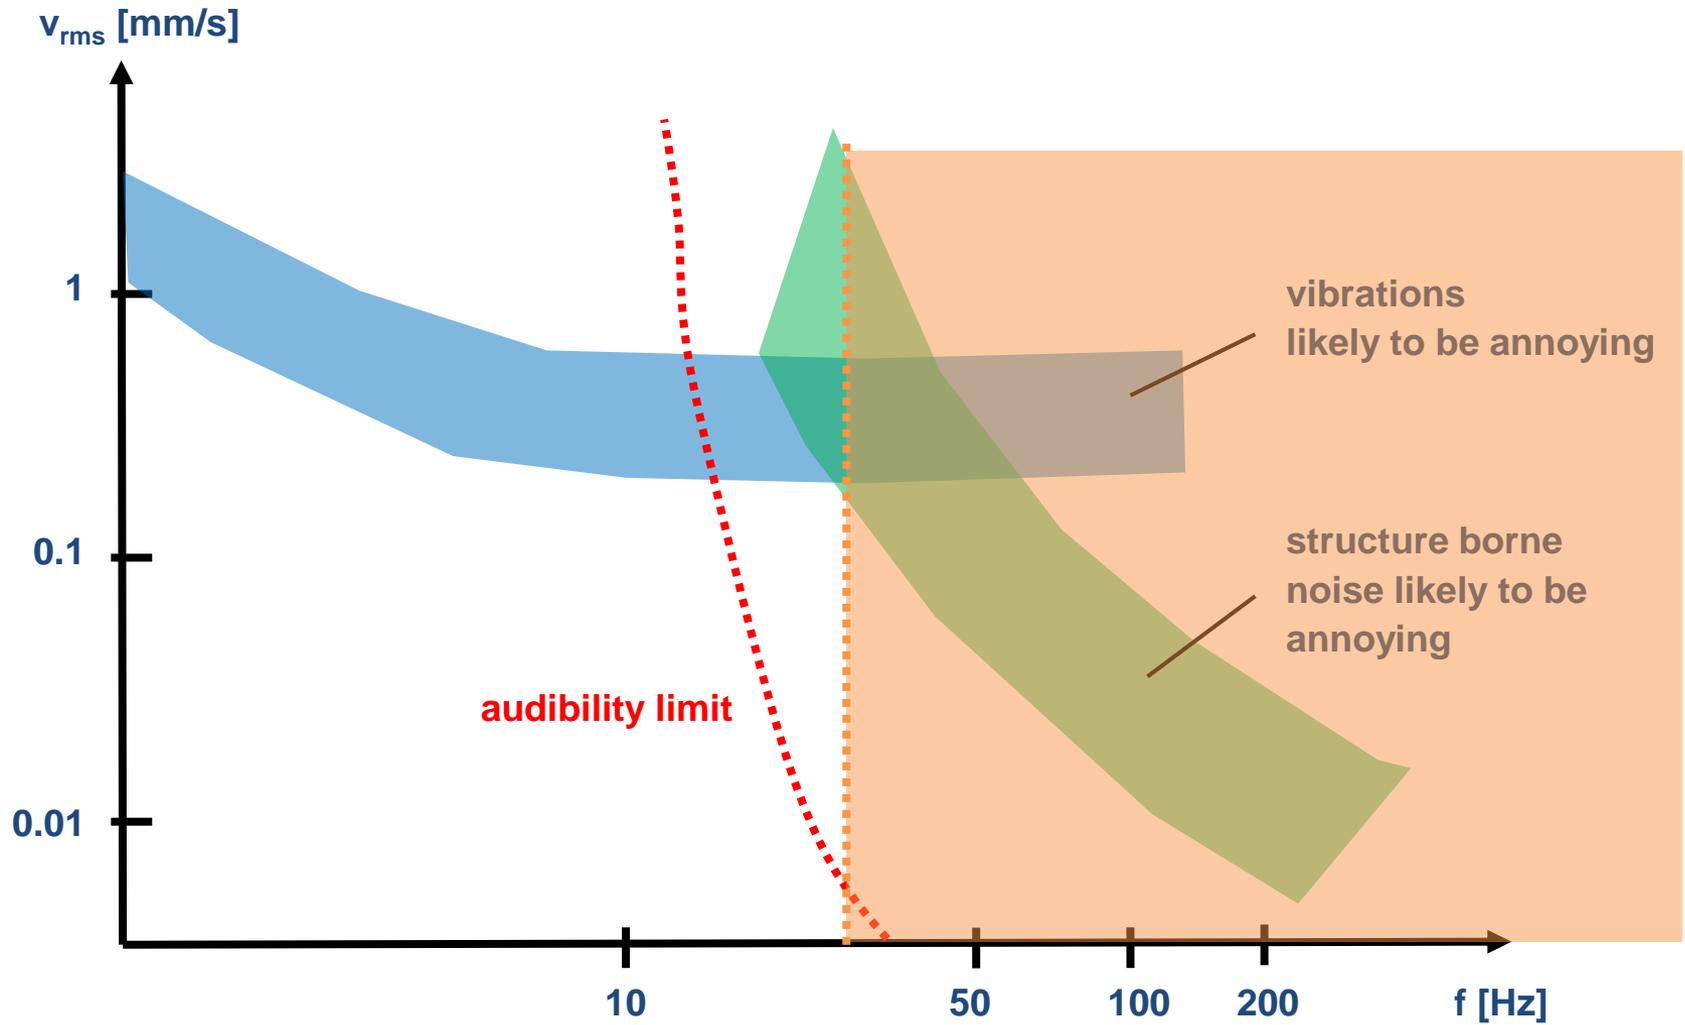

**Avg. insertion loss:  
-11.6dBv**

**Reduction of  
vibrations: -74%**

— Insertion Loss

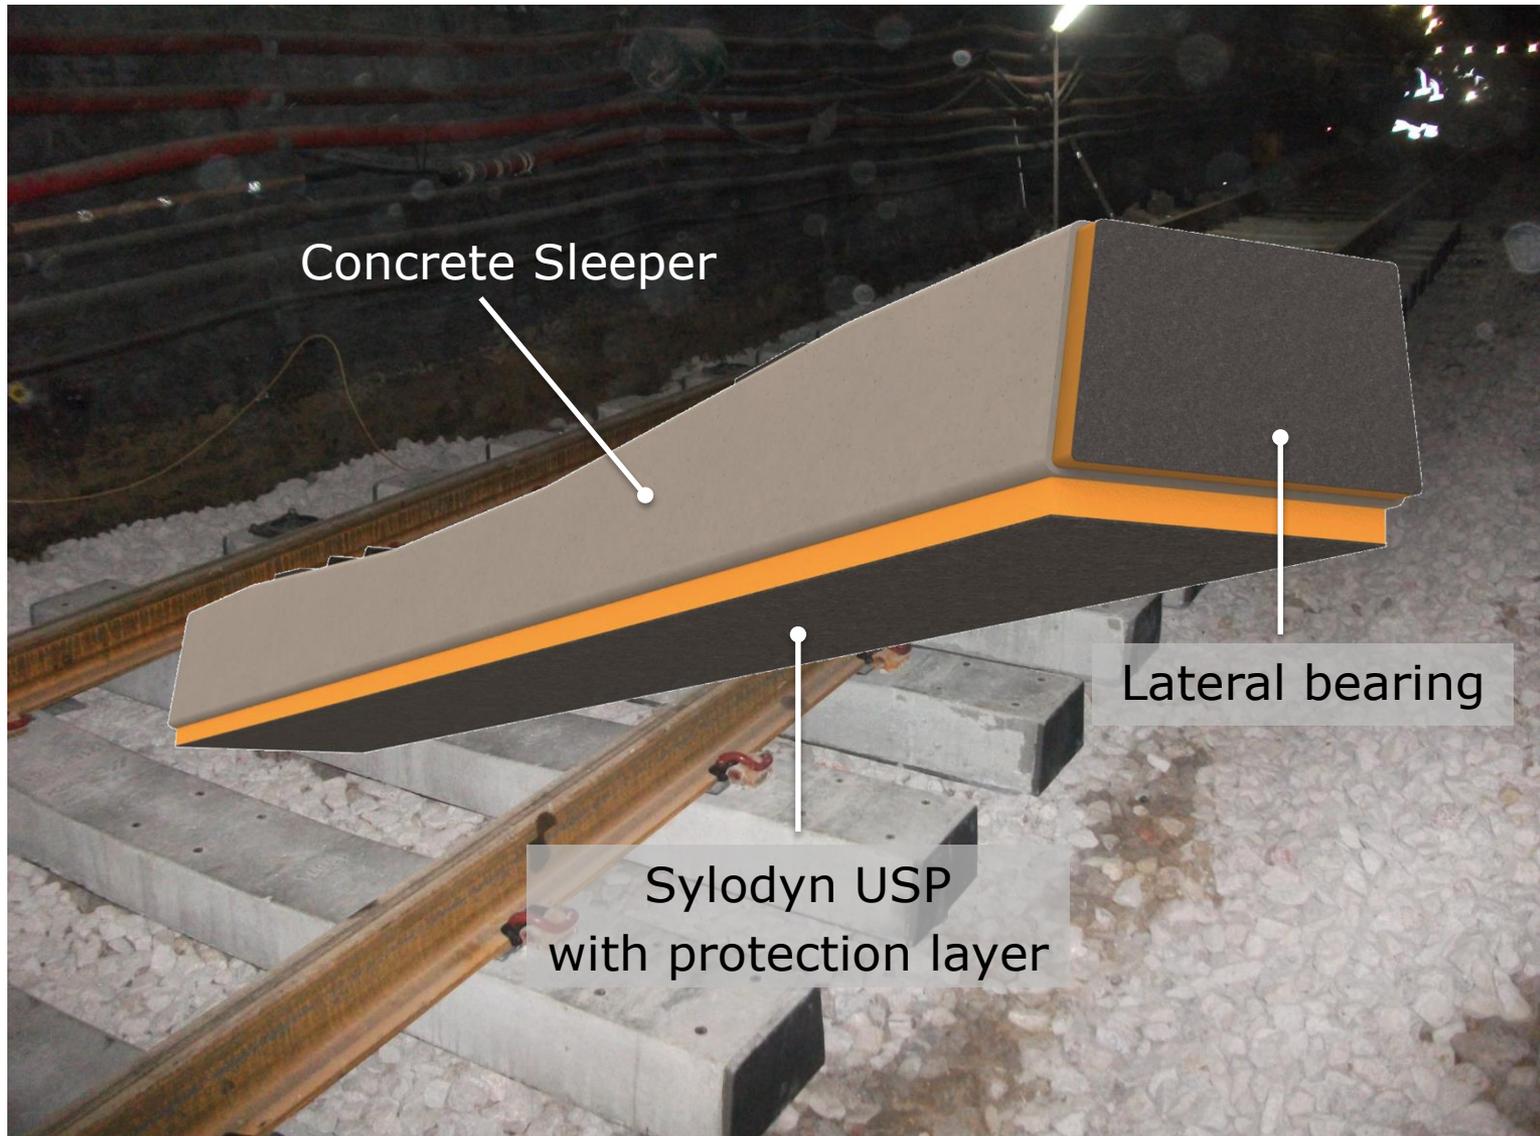

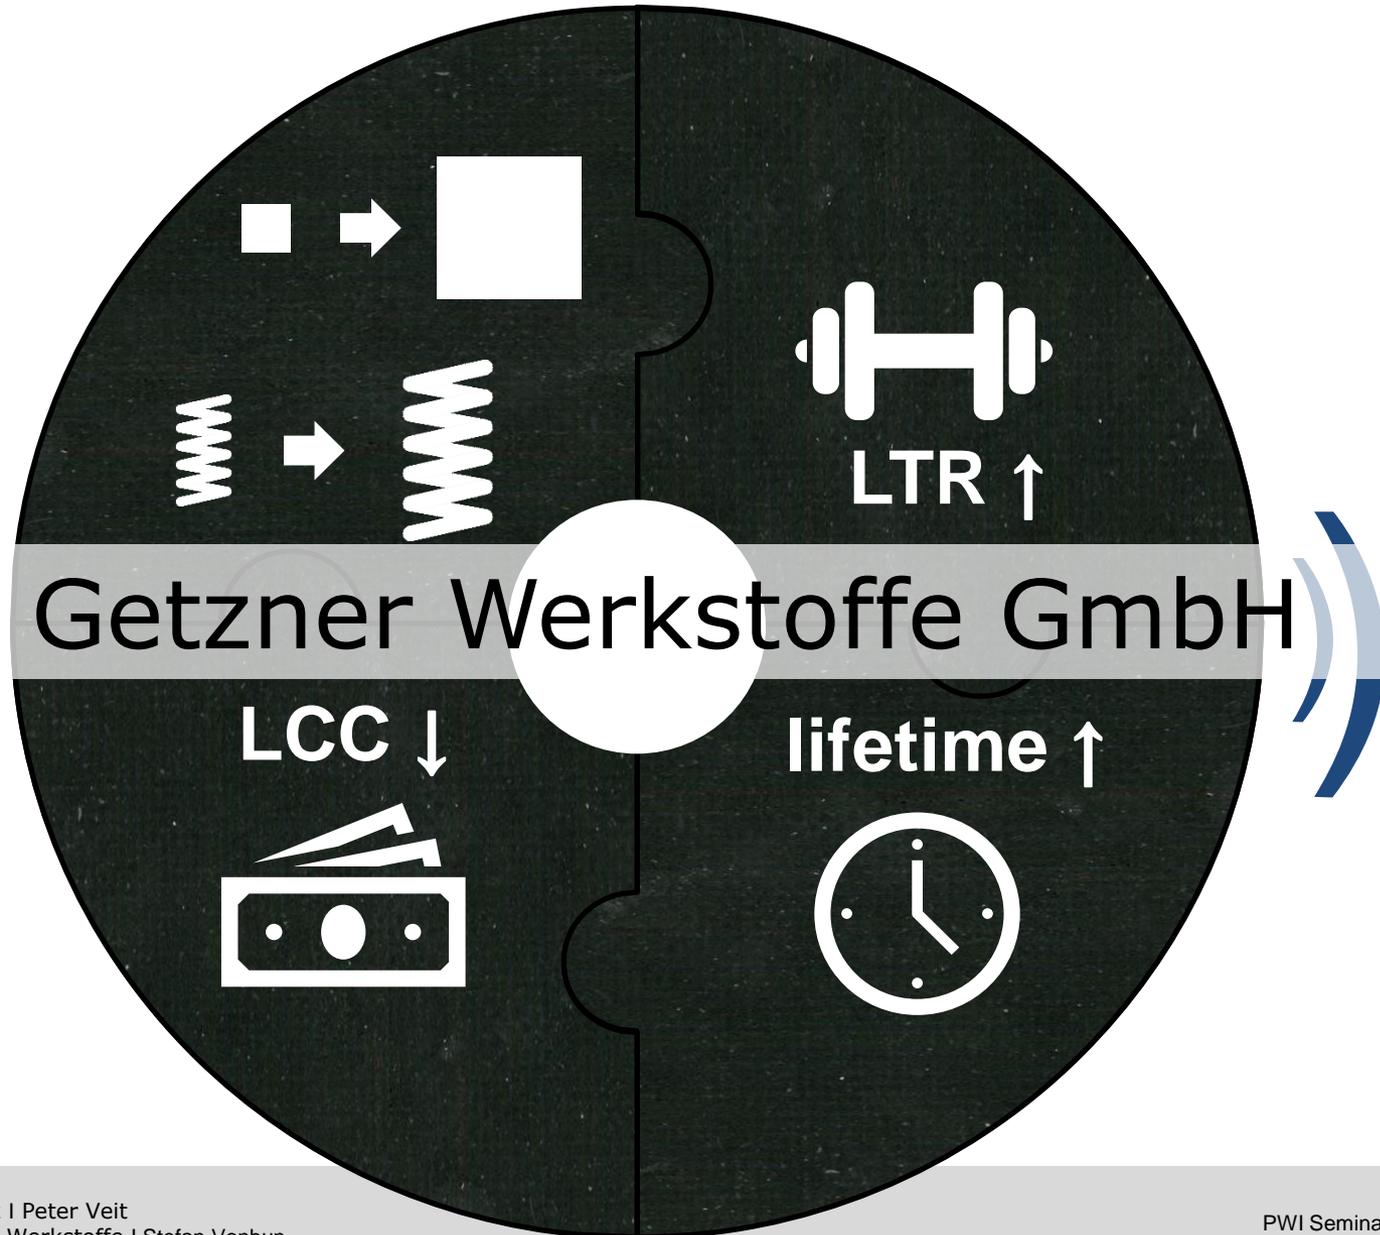

# Case Study: London Underground

standard superstructure

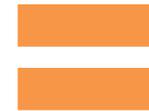

PUR padded sleepers

30+ years

Lifetime sleeper = lifetime USP

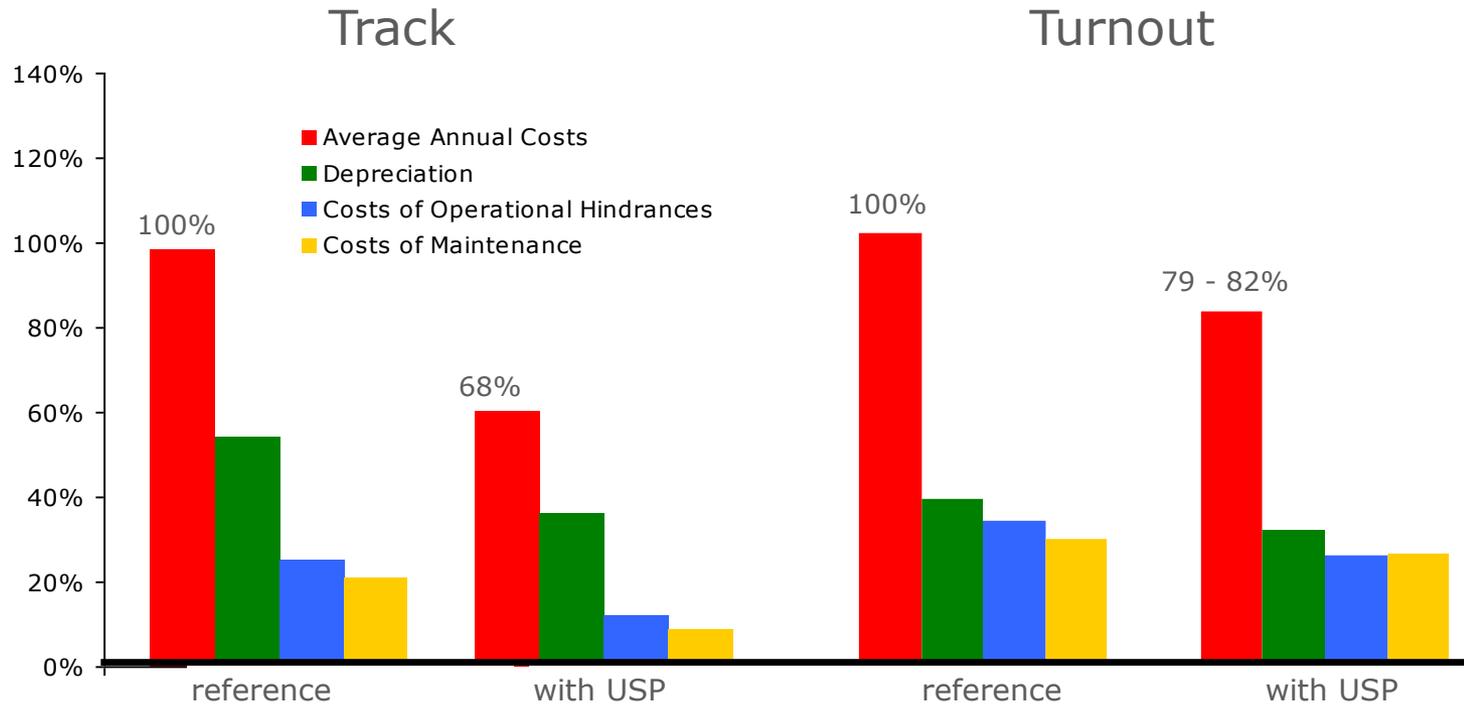

more sustainable & more silent superstructure

# Summary

There is nothing more expensive than short term savings.

There is nothing more economic than high quality.
